Education

- **University of Michigan** — Ann Arbor, MI
  Master of Business Analytics - Stephen M. Ross School of Business — *Jul 2024 - May 2025*
  Relevant Courses: *Software Teams & Project Management, Decision Strategies, Predictive Analytics, Prescriptive Analytics, Unsupervised Learning, Data Architecture & Acquisition, Causal Inference, Marketing Analytics*
- **University of Michigan** — Ann Arbor, MI
  Bachelor of Science in Computer Science & Statistics (Double Major) – 3.52 — *Aug 2020 - Apr 2024*
  Relevant Courses: *Web Systems, Data Mining & Statistical Learning, Database Management Systems, Computational Methods in Statistics, Applied Regression Analysis, Information Retrieval & Web Search, Bayesian Data Analysis, User Interface Development*

Technical Skills

- **Programming & Development:** TypeScript, JavaScript, Python, SQL, C++, R, React, Next.js, Node.js, Deno, Flask, HTML5, CSS3
- **Backend, APIs & Cloud:** REST APIs, OAuth, Webhooks, Serverless Functions, PostgreSQL (Supabase), MongoDB, BigQuery, GCP, AWS, Microsoft Azure, Vercel
- **AI, Data & Analytics:** LLM APIs (Claude, OpenAI, Grok), Pandas, NumPy, PySpark, Apache Airflow, A/B Testing, PostHog, Tableau, Power BI
- **Tools & Environments:** Git, GitHub, GitHub Actions (CI/CD), Open Code, Figma, Microsoft Excel

Experience

- **Clipt** — Remote
  Co-Founder — *August 2025 - Present*
  - Co-founded and engineered Clipt, a creator marketplace that grew to 6,200+ users and 27M+ tracked views across TikTok, Instagram, YouTube, and X since launch, owning product design, architecture, auth, payments, and deployment
  - Architected a double-entry payments ledger (41,000+ entries) with escrowed campaign funding, creator wallets, webhooks, and idempotent payouts, settling 6,500+ creator earnings with automated balance drift detection
  - Designed a fraud scoring pipeline that checks every clip against cross-platform engagement signals before payout, flagging 795 of 3,000 submissions for review and blocking $800+ in invalid payouts
  - Automated view metric collection from 4 social platforms with scheduled pipelines using official APIs and creator logins, storing 35,000+ snapshots that drive pay-per-view earnings
  - Established the CI and testing system that keeps AI-written code production-safe across 630+ merged PRs, combining database security tests (row-level and column-level access), staged schema migrations, full-flow payment tests, and preview deploy QA, with every change verified before merge
- **Ford Motor Company** — Dearborn, MI
  Analytics Scientist — *June 2025 - Present*
  - Validated the full Teradata-to-GCP data migration through SQL-based reconciliation scripts and BigQuery, ensuring 100% accuracy across 10+ credit risk pipelines
  - Led end-to-end development of probability-of-payment models that set risk-based lease rates from business credit history, using large-scale credit bureau data, PSI/CSI stability testing, IV/WOE analysis, and correlation filtering to strengthen risk stratification across $5M+ in receivables
  - Audited 50K+ commercial lending applications, identified data gaps in third-party credit reports, and streamlined reporting to support origination and risk strategy teams
- **Microsoft** — Ann Arbor, MI
  Graduate Consulting Analyst — *Jan 2025 - May 2025*
  - Developed automated Python scripts through control theory techniques (XmR control charts, time-series analysis) to identify statistically significant deviations in product metrics and flag performance risks
  - Enabled cloud and software engineering teams to proactively monitor product health by distinguishing meaningful trends from noise, reducing response time to emerging issues and improving decision-making consistency
  - Orchestrated recurring analyses by integrating Python workflows with Power BI dashboards and version-controlled GitHub processes, boosting accuracy, scalability, and accessibility of performance insights across teams
- **Urban Science** — Detroit, MI
  Data Engineer Intern — *May 2023 - Aug 2023*
  - Built and optimized scalable data pipelines and ETL processes using Python and SQL, systemizing the ingestion and transformation of large-scale demographic datasets, accelerating processing speed by 55%
  - Engineered an asynchronous Azure application with Microsoft's Graph API to fetch, filter, and process email attachments based on adaptive SQL criteria, reducing data retrieval time by 60% and supporting business strategy
  - Integrated Python-based analytics tools with SQL and C# systems to deliver real-time insights that informed cross-functional business decisions on automotive market trends
